

## What is Symmetry

Shapes have many different qualities. Some have curved edges, and some have straight edges. Some have three sides, while others have four or more sides. Another quality shapes may have is that of being symmetrical.

Symmetry describes shapes that, when divided in half, both sides are exactly the same. We often call these mirror images. Unsure if a shape is symmetrical? Draw a line down the middle of the shape and fold it in half. If the two halves match, they are symmetrical. If not, they are called asymmetrical.
